

SYSTEM AND METHOD FOR ACCESS POINT TRANSLATION OF WEB SERVICE CONTENT

ABSTRACT

A system and method for using a network access point to implement
5 transparent Web Service functionality between processing deficient terminals and Web
Service providers by allowing the terminals to access Web Services using abbreviated Web
Service requests. The abbreviated Web Service requests are then translated into
conventional Web Service requests by the network access point and subsequently
forwarded onto the Web Service provider. The conventional Web Service response is then
10 optionally translated into an abbreviated response to accommodate the processing
deficiencies of the Web Service requestor.
